Abstract

Diffusion as a function of temperature of benzimidazole and chromene dyes. It is well known that a carrier is not required for the dyeing of polyester at temperature exceeding 100° C (high temperature dyeing process). This is due to the fact that the diffusion coefficient increases with rising temperature. The extent of this increase was found by measuring exhaustion curves at different temperatures.

Introduction

The dyeing process in case of polyester and wool was carried out near the boiling. It was expected that the dependence on temperature of these diffusion D_T value would be in accordance with the relation:

$$D_T = D_o\, e^{-E/RT}$$

Where D_o= K is a constant. E is the molar energy of activation. T is the absolute temperature and R is the general gas constant. A straight line must be obtained when lin k is plotted against 1/T. The energy of activation E can then be calculated from the slope of this straight line.

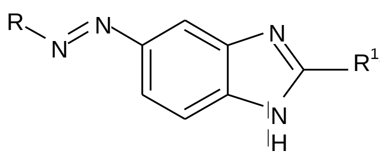
By the same method we can determine the free energy at different temperature by the law [1-6].

$$-\Delta G_T = RT \text{ lin } [\,Df\,] / [D_S]$$

$$\Delta H^o = \Delta G_{100}{}^o + T_{100}\,\Delta S^o$$

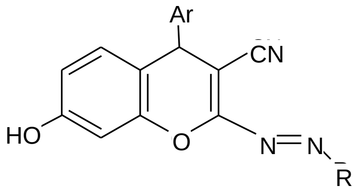
Experimental:

The chemical structures of the synthesized dyes are:



I - III

I, R[1] = H; II, R[1] = CH3; III, R[1] = CF3.



IV & V

IV, -Ar = phenyl; V, Ar = 4-chlorophenyl.

I, II & III:

R=

a, 
; b, 
; c, 
;

d, 
; e 
;f, 
.

IV : R= a, 
; b, 
; c, 
d, 
; e , 
; f, 
;

g, 
; h, 
; i, 
.

V : R= a, 
; b, 
; c, 
;

d, 
; e, 
; f, 
The syntheses of these dyes were described in another submitted article(7).

Dyeing Exhaustion curves:

The rate of exhaustion was determined by measuring the optical density of the dye bath solution at different periods up to two hours, using lambada – 3B-spectrophotometer .

II- Materials for dyeing.

Polyester, Polyester woolen type denir 1.4 and wool produced locally at (Misr Rayon Co. Kafr El Dawer and El Mehalla El Kubra), Egypt.

III. Instrumentation and measurements.

1- Melting Point apparatus   2- Spectrophotometric analysis

3- Colour measurements.

Results and Discussions

The rate of exhaustion of the dyeing bath was measured near the boiling by measuring the optical density of the dye bath solution at the previously predetermined λ max for each dye initially and after different periods of time 5,15,25 ………and 120 minutes[8].

$$\% \text{ Exhaustin} = \frac{Aso - Ast}{Aso} \times 100$$

Where Aso = Absorbance at zero time

Ast = Absorbance at time (t)

% of exhaustion of group III dyes on wool fibre											
III a	55	65	76	82	90						
b	52	62	72	80	90						
c	50	60	71	80	90						
d	52	62	72	80	90						
e	54	64	74	82	92						
f	54	70	82	86	88						

The results obtained indicate that the dye uptake increased with the increase in time of dyeing. The increased dye up take with the increase of time of dyeing can be attributed to the need of the dye molecule to diffuse inside the fibre and reached to maximum dye up- take.

The obtained results for the prepared disperse dyes (I –V) on polyester fibre from table (2) indicate that

i) The maximum dye up take range (74 – 88)% and this indicate that very good dye up take by the fibre .

ii) The T1/2 min for the prepared disperse dyes ranged from (18.5-28.5) this, indicate that good dyeing process on polyester fibre.

iii) The velocity cons. for the prepared disperse dyes ranged from (11.6 – 19.3) this indicates that slow rate for dyeing mechanism good dyeing process.

d	26	53	59	69	70	74	80	27	54	62	66	71	79	90	
e	24	51	55	60	65	72	78	26	52	60	68	76	79	92	
f	27	51	53	55	58	66	78	32	54	62	69	71	79	88	
IV a	30	54	60	64	69	75	88								
b	28	51	57	68	70	75	82								
c	26	52	55	65	68	70	80								
d	28	51	58	60	67	72	78								
e	26	52	55	60	68	76	82								
f	30	54	60	66	70	76	84								

The results obtained indicate that the dye uptake increased with the increase in temperature of dyeing. The increased dye up take with the increase of temperature of dyeing can be attributed to the need of the dye molecule for high thermal energy to over came the energy barrier of the fibre water interface[9]

Thermodynamic behavior of some prepared dyes on polyester fibre [10].

Table (8): Calculation of ΔG, ΔG/T, 1/T for the prepared dyes under investigation.

Dye No	(T)° K	$-\Delta G^{\circ}\times10^{3}$	$\frac{\Delta G}{T}$	$\frac{1}{T}$
I a	323	0.21	0.65	3.1×10^{-3}
	333	0.47	1.41	3×10^{-3}
	343	0.83	2.42	2.9×10^{-3}
	373	1.13	3.03	2.7×10^{-3}

Table (9) :- Thermodynamic function of some dyes

Dye No	ΔE	- ΔG×10[3]	ΔH×10[3] K.cal.	-ΔS cal ȯ K^{-1} mole $^{-1}$
I_a	780	1.13	7.6	87.3
II_a	1050	1.24	8.0	92.4
III_a	1150	1.36	7.35	87.1
IV_a	850	1.94	5.0	64.9
I_f	815	1.04	5.2	62.4

The results obtained from table (**9**) indicate that:

1)- ΔG ranged from 1.04-1. 94 positive value indicate the real dyeing process on polyester fibre sample.

2)- (- Δ S) ranged from 62.4-92.4 cal K^{-1} mole $^{-1}$ high positive value this ȯ indicate that the dye molecule inside the fibre is regular and arrangement inside the fibre this module for completing dying process

3)- | ΔH | ranged from 5-8 K cal this indicate that the dyeing process completing by diffusion controlled not by chemical bonding reaction which has the | ΔH| value ranged from 18-27 K .cal.

4)- (-ΔH) has positive value ranged from 5-8 k.cal this indicate that the dyeing process is exothermic process.

Conclusion

From this research of benzimidazole and chromene dyes found that:

- ΔG ranged from 1.04-1. 94 positive value indicate the real dyeing process on polyester fibre sample.

- Δ S ranged from 62.4-92.4 cal K^{-1} mole $^{-1}$ high positive value this ȯ indicate that the dye molecule inside the fibre is regular and arrangement inside the fibre, also bonded suggesting module for completion of dying process

-ΔH has positive value ranged from 5-8 k.cal this indicate that the dyeing process is exothermic process.
